QUALITY ASSURANCE POLICY STATEMENT

CES (Asia) Ltd is committed to provide to our clients the most responsive and professional environmental consulting services in Asia.

It is the Company's objective to provide services which meet the required specification and are produced on time in a cost-effective manner.

In pursuit of these objectives, the Directors have implemented Quality Systems which have achieved Third Party Certification to BS EN ISO 9001:1994 Standard. All employees of the Company have a responsibility for quality.

The quality procedures are under continual review by Senior Management to ensure that the changing needs of the Company's Clients are met.

1 INTRODUCTION

1 INTRODUCTION

1.1 General

CES (Asia) Ltd, was commissioned by the Highways Department (HyD), Major Works Project Management Office under Agreement CE29/96 to carry out the Environmental Impact Assessment and MVA Asia Ltd, is the sub-consultant for the Traffic Impact Assessment for the "Flyover at Tai Chung Kiu Road/Siu Lek Yuen Road" feasibility study.

1.2 Purpose of the Manual

The purpose of this Environmental Monitoring and Audit (EM&A) Manual is to guide the setup of an EM&A programme to ensure compliance with the Environmental Impact Assessment (EIA) study recommendations, to assess the effectiveness of the recommended mitigation measures and to identify any further need for additional mitigation measures or remedial action. This Manual outlines the monitoring and audit programme to be undertaken for the construction of the flyover at Tai Chung Kiu Road/Siu Lek Yuen Road. It aims to provide systematic procedures for monitoring, auditing and minimising environmental impacts associated with the construction works.

Hong Kong environmental regulations for air quality, water quality and noise, the Hong Kong Planning Standards and Guidelines, and recommendations in the EIA study report on the project "Flyover at Tai Chung Kiu Road/Siu Lek Yuen Road" have served as environmental standards and guidelines in the preparation of this Manual.

This Manual contains the following:

- (a) duties of the *Environmental Team (ET)* with respect to the environmental monitoring and audit requirements during construction;
- (b) information on project organisation and programming of construction activities for the project;
- (c) requirements with respect to the construction schedule and the necessary environmental monitoring and audit programme to track the varying environmental impacts;
- (d) definition of Action and Limit levels;
- (e) establishment of event and action plans;
- (f) requirements of reviewing pollution sources and working procedures required in the event of non-compliance with environmental criteria; and
- (g) requirements of presentation of environmental monitoring and audit data and appropriate reporting procedures.

Hereinafter, the term "Engineer" shall refer to the Engineer as defined in the Contract and the Engineer's Representative (ER), in cases where the Engineer's powers have been delegated to the ER, in accordance with the Contract. The "ET leader", who shall be responsible for and in charge of the ET, shall refer to the person delegated the role of executing the environmental monitoring and audit requirements.

1.3 Background

1.3.1 The Proposed Project

Tai Chung Kiu Road is a major traffic link between Sha Tin and Ma On Shan. It carries traffic from the Ma On Shan area to the Lion Rock Tunnel/Shing Mun Tunnel and other major traffic generators in Sha Tin like the railway stations and the New Town Plaza.

With the development in Ma On Shan and the natural growth of traffic, it is anticipated that the existing junction of Tai Chung Kiu Road and Siu Lek Yuen will be operating over capacity at 20% and 28% in the morning peak and evening peak respectively in the year 2001.

The construction of a single 2-lane flyover across the junction has been identified by the Ma On Shan Area 77, 86B and 90B Potential Development Traffic Impact Study in June 1995 to improve the junction capacity to cater for the growth in traffic. The Study Area is shown in Figure 1.1.

The proposed scope of the project comprises:

- a single 2-lane flyover of about 260m in length along Tai Chung Kiu Road over the junction with Siu Lek Yuen Road; local road widening on both sides of Tai Chung Kiu Road near the junction to accommodate the flyover;
- widening of a portion of the existing nullah bridge;
- modification to road junction layout and improvement to the signal control arrangement;
- noise mitigation measures, including noise barriers along the southern edge of the flyover facing City One Shatin, the extent and scope is subject to review; and
- ancillary drainage works.

1.3.2 Mitigation Measures Recommended for the Operational Phase of the Proposed Project

The Environmental Impact Assessment Study included the analysis of traffic noise. The recommended mitigation measures as follows:

- 6m barrier with a cantilever to within 1m of the flyover centreline on the City One Estate side of the flyover; and
- reduction to a 4m vertical barrier after the road junction, up to Siu Lek Yuen Playground.

Further details can be found in the EIA of the Flyover at Tai Chung Kiu Road/Siu Lek Yuen Road Study, Final Report (Agreement No. CE 29/96) dated March 1998.

1.3.3 Sensitive Receivers Summary

The noise and air quality sensitive receivers include residential blocks of City One Shatin (mainly Blocks 3, 4, 5, 6, 13, 14, 15), Belair Garden (mainly Block N), Ravana Garden, and two schools (Baptist Lui Ming Choi Primary School (City One Shatin), and Leung Kui Kau Lutheran Primary School

(Ravana Garden)). Recreational Users, including the Siu Lek Yuen Road Playground/Bowling Greens and the Floating Restaurant Garden are also air quality sensitive receivers.

1.3.4 Environmental Monitoring and Audit Requirements

The EM&A programme for this study, as identified in the EIA, involves baseline, impact and compliance monitoring in the areas of:

- Noise;
- Air quality; and
- Water quality

The environmental monitoring and audit requirements recommended in the EIA are detailed in the relevant sections of this report. Impacts at Sensitive Receivers (SRs) may be minimized to acceptable levels according to Hong Kong environmental regulations provided environmental monitoring and auditing and environmental mitigation measures are implemented. A summary of the environmental mitigation measures recommended in the EIA are as follows (further elaboration on these mitigation measures can be found in Sections 2.8, 3.7 and 4.6):

Noise Mitigation:

Use of quietened equipment; restricted hours and appropriate programming of construction work; use of acoustic screen; proper location, operation and

placing of noisy equipment.

Dust Mitigation:

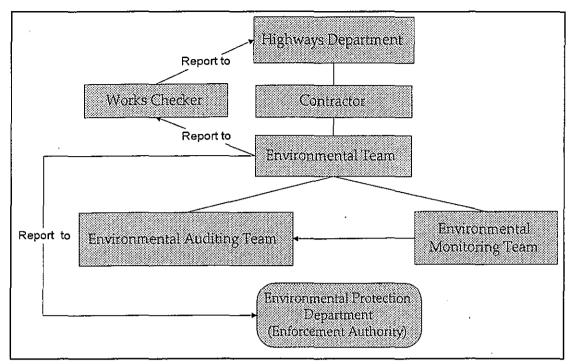

Periodic watering of site area; speed controls for vehicles on unpaved site roads; vehicle wheel and body washing stations at exit point of site and public roads; use of enclosures to contain spreading of dust; use of tarpaulins to cover soil transferred in lorries.

1.4 Project Organization

The proposed project organisation and lines of communication with respect to environmental protection works are shown in Figure 1.2.

Based on the organisation chart, the ET's work will be reported directly to the Contractor, who will liaise with the Highways Department via the ER. The Environmental Team shall comprise the environmental monitoring team which shall be directly employed by the contractor and perform their duties independently, and the environmental auditing team which shall be formed by appointing resident site staff with relevant professional qualifications and appropriate auditing experience. The environmental monitoring team shall provide all monitoring data to the environmental auditing team. The ET leader shall have relevant professional qualifications, or have sufficient relevant EM&A experience subject to approval of the ER.

Figure 1.2 Project Organisation

Appropriate staff, including air and noise specialists, shall be included in the ET, under the supervision of the ET Leader, to fulfil the EM&A duties of the ET Leader specified in this Manual.

The duties comprise the following:

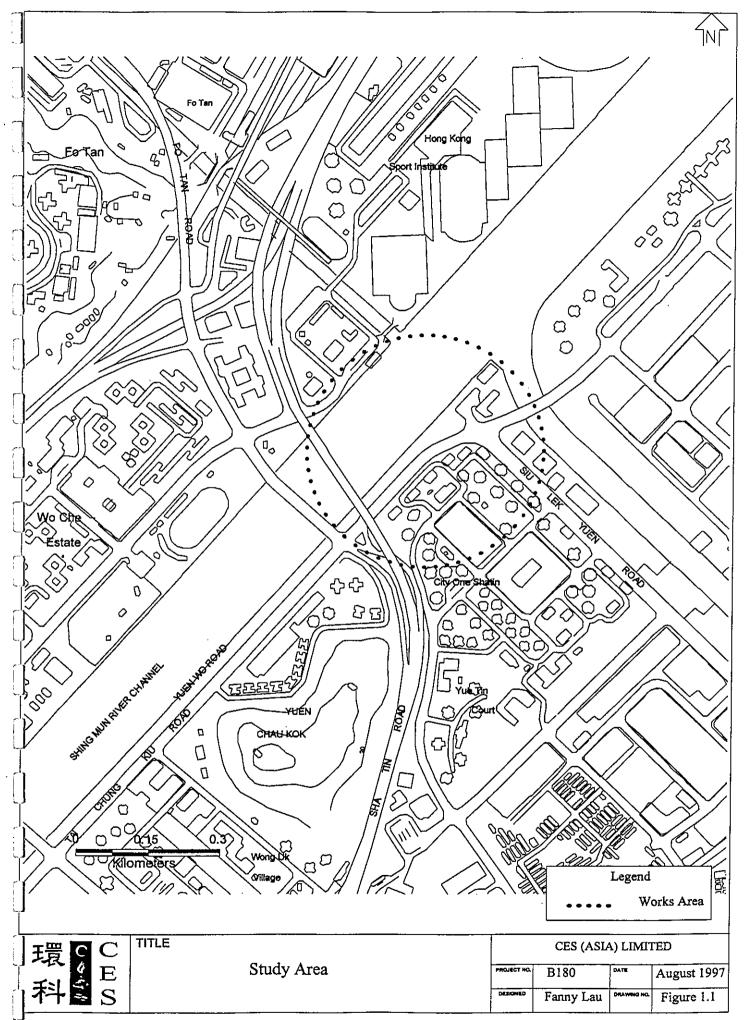

- (a) to monitor the various environmental parameters as required in the EIA study Final Report.
- (b) to investigate and audit the Contractors' equipment and work methodologies with respect to pollution control and environmental mitigation, and anticipate environmental issues for proactive action before problems arise.
- (c) to audit and prepare audit reports on the environmental monitoring data and the site environmental conditions; and
- (d) to report on the environmental monitoring and audit results to the Contractor and the ER.

Appropriate resources shall be allocated by the Contractor to fulfil duties specified in this Manual.

The Environmental Protection Department's (EPD) role, as indicated in Figure 1.2, is that of the Enforcement Authority. They are responsible for enforcing environmental protection and pollution control laws in Hong Kong, which the Contractor is legally bound to comply with.

1.5 Construction Programme

A tentative construction programme has been produced by HyD and is shown on Figure 1.3. However, the Contractor shall provide the finalised programme to the ET prior to the commencement of any work. The ET leader shall make reference to the actual construction works progress and programme to schedule the EM&A works.

2 AIR QUALITY

2 AIR QUALITY

2.1 Air Quality Parameters

Monitoring and audit of Total Suspended Particulates (TSP) levels shall be carried out by the ET to ensure that any deteriorating air quality could be readily detected and timely action taken to rectify the situation.

One-hour and 24-hour TSP levels shall be measured to indicate the impacts of construction dust on air quality. The 24-hour TSP levels shall be measured by following the standard high volume sampling method as set out in the Title 40 of the Code of Federal Regulations, Chapter 1 (Part 50). Upon approval of the ER, 1-hour TSP levels can be measured by direct reading methods which are capable of producing comparable results as that by the high volume sampling method, to indicate short event impacts.

All relevant data including temperature, pressure, weather conditions, elapsed-time meter reading for the start and stop of the sampler, identification and weight of the filter paper, and other special phenomena and work progress of the concerned site shall be recorded in detail. A sample data sheet is shown in Table 2.3.

2.2 Monitoring Equipment

High volume samplers (HVS) in compliance with the following specifications shall be, provided by the Contractor and shall be used for carrying out the TSP monitoring:

- (a) 0.6-1.7 m³/min (20-60 SCFM) adjustable flow range;
- (b) equipped with a timing/control device with ± 5 minutes accuracy for 24 hours operation;
- (c) installed with elapsed-time meter with ± 2 minutes accuracy for 24 hours operation;
- (d) capable of providing a minimum exposed area of 406 cm² (63 in²);
- (e) flow control accuracy: ± 2.5% deviation over 24-hour sampling period;
- (f) equipped with a shelter to protect the filter and sampler;
- (g) incorporated with an electronic mass flow rate controller or other equivalent devices;
- (h) equipped with a flow recorder for continuous monitoring;
- (i) provided with a peaked roof inlet;
- (j) incorporated with a manometer;
- (k) able to hold and seal the filter paper to the sampler housing at horizontal position;
- (l) easy to change the filter; and
- (m) capable of operating continuously for 24-hour period.

The ET is responsible for provision of the monitoring equipment and carrying out the baseline monitoring, regular impact monitoring and ad hoc monitoring. The HVSs shall be equipped with an electronic mass flow controller and be calibrated against a traceable standard at regular intervals. All the equipment, calibration kit, filter papers, etc. shall be clearly labelled.

Initial calibration of dust monitoring equipment shall be conducted upon installation and thereafter at bi-monthly intervals. The transfer standard shall be traceable to the internationally recognised primary standard and be calibrated annually. The calibration data shall be properly documented for future reference. All the data shall be converted into standard temperature and pressure condition.

The flow-rate of the sampler before and after the sampling exercise with the filter in position shall be verified to be constant and be recorded in the data sheet.

If the ET leader proposes to use a direct reading dust meter to measure 1-hr TSP levels, he shall submit sufficient information to the ER to prove that the instrument is capable of achieving comparable results as the HVS and may be used for the 1-hr sampling. The instrument should also be calibrated regularly, and the 1-hr sampling shall be determined periodically by HVS to check the validity and accuracy of the results measured by direct reading method

Wind data monitoring equipment shall also be provided and set up at conspicuous locations for logging wind speed and wind direction near to the dust monitoring locations. The equipment installation location shall be proposed by the ET Leader and agreed with the ER. For installation and operation of wind data monitoring equipment, the following points shall be observed:

- the wind sensors shall be installed on masts at an elevated level 10m above ground so that they are clear of obstructions or turbulence caused by any buildings;
- the wind data shall be captured by a data logger and to be downloaded for processing at least once a month;
- the wind data monitoring equipment shall be re-calibrated at least once every six months;
 and
- wind direction shall be divided into 16 sectors of 22.5 degrees each.

In exceptional situations, the ET leader may propose alternative methods to obtain representative wind data upon approval from the ER.

2.3 Laboratory Measurement/Analysis

A clean laboratory with constant temperature and humidity control, and equipped with necessary measuring and conditioning instruments, to handle the dust samples collected, shall be available for sample analysis, and equipment calibration and maintenance. The laboratory should be HOKLAS accredited.

If an independent site laboratory is set up or a non-HOKLAS accredited laboratory is appointed to carry out the laboratory analysis, the laboratory equipment shall be approved by the ER and the measurement procedures shall be witnessed by the ER. The ET Leader shall provide the ER with one copy of the Title 40 of the Code of Federal Regulations, Chapter 1 (Part 50).

Clean filter paper, with no pin holes, of size 8"x10" shall be labelled before sampling. Filter paper shall be conditioned in a humidity controlled chamber for 24-hours and pre-weighed prior to use in any sampler.

After sampling, the filter paper loaded with dust shall be kept in a clean and tightly sealed plastic bag. The filter paper should then be returned to the laboratory for reconditioning in a humidity controlled chamber followed by precision weighing using an electronic balance which ,is capable of weighing down to 0.1 mg. The balance shall be regularly calibrated against a traceable standard.

All the collected samples shall be kept in a good condition for 6 months before disposal.

2.4 Monitoring Locations

The dust sensitive receivers identified in the EIA study are shown in Figure 2.1. It is recommended that station 5 is chosen as the suggested location for dust monitoring. This monitoring location should not be considered contractually binding as the contractor may find practical reasons for changing this when establishing the final locations. It should also be noted that the status and locations of dust sensitive receivers may also change after the issue of this Manual. If such cases exist, the ET Leader shall propose an updated monitoring location and seek approval from the ER.

If an alternative monitoring location is proposed the following criteria should be followed:-

- at the site boundary or such location close to the major dust emission source;
- close to the sensitive receptors; and
- take into account the prevailing meteorological conditions.

The ET Leader shall agree with the ER on the position of the HVS for installation of the monitoring equipment. When positioning the samplers, the following points shall be noted:

- (a) a horizontal platform with appropriate support to secure the samplers against gusty wind should be provided;
- (b) the distance between the sampler and an obstacle, such as buildings, must be at least twice the height that the obstacle protrudes above the sampler;
- (c) a minimum of 2 metres of separation from walls, parapets and penthouses is required for rooftop samplers;
- (d) a minimum of 2 metres separation from any supporting structure, measured horizontally is required;
- (e) no furnace or incinerator flue is nearby;
- (f) airflow around the sampler is unrestricted;
- (g) the sampler is more than 20 metres from the dripline;
- (h) any wire fence and gate, to protect the sampler, should not cause any obstruction during monitoring;
- (I) permission must be obtained to set up the samplers and to obtain access to the monitoring stations; and
- (j) a secure supply of electricity is available.

2.5 Baseline Monitoring

As part of the EIA study baseline monitoring was carried out in April 1997, the results of which are presented in Appendix A. Nevertheless, baseline monitoring shall be required prior to the commencement of any works. This baseline monitoring shall be carried out at the designated monitoring location for 14 consecutive days prior to the commissioning of the construction works to obtain daily 24-hr TSP samples.

During the baseline monitoring, there should not be any construction or dust generation activities in the vicinity of the monitoring station.

In case the baseline monitoring cannot be carried out at the identified monitoring location during the baseline monitoring period, monitoring at an alternative location, which can effectively represent the baseline conditions at the impact monitoring locations, should be carried out upon the approval of the ER.

Ambient conditions may vary seasonally and shall be reviewed at quarterly intervals. When the ambient conditions have changed and a rerun of the baseline monitoring is required to obtain updated baseline levels, the monitoring should be scheduled for times when the contractor's activities are not generating dust, at least in the proximity of the monitoring stations. The revised baseline levels and air quality criteria shall be agreed with the ER.

2.6 Impact Monitoring

Impact monitoring shall be carried out throughout the construction period. For regular impact monitoring, the sampling frequency of at least once in every six-days, shall be strictly observed at the monitoring station for 24-hr TSP monitoring. For 1-hr TSP monitoring, the sampling frequency of at least three times in every six-days should be undertaken when high dust impacts are anticipated.

The specific time to start and stop the 24-hr TSP monitoring shall be clearly defined and strictly followed by the ET for each location.

In the event of non-compliance with the air quality criteria, more frequent monitoring as specified in the Action Plan in Section 2.7 shall be conducted within 24 hours of the recorded exceedance. This additional monitoring shall be continued until excessive dust emissions or the deterioration in air quality is rectified.

2.7 Event and Action Plan for Air Quality

The baseline monitoring results form the basis for determining the air quality criteria, namely Action and Limit levels, for the impact monitoring. Table 2.1 shows action and limit levels for air quality. When exceedance of Action and Limit levels occurs, recommended action shall be undertaken to control environmental impacts to acceptable levels. The action plan is shown in Table 2.2.

Table 2.1 Action and Limit Levels for Air Quality

Parameters	Action	Limit				
24 Hour TSP Level in μg/m³ For baseline level < 108 μg/m³, Action level = average of baseline level plus 30% and Limit level For baseline level > 108 μg/m³ and baseline level < 154 μg/m³, Action level = 200 μg/m³ For baseline level > 154 μg/m³, Action level = 130% of baseline level						
1 Hour TSP Level in μg/m³	For baseline level < 154 μ g/m³, Action level = average of baseline level plus 30% and Limit level For baseline level > 154 μ g/m³ and baseline level < 269 μ g/m³, Action level = 350 μ g/m³ For baseline level > 269 μ g/m³, Action level = 130% of baseline level	500				

Table 2.2 Event/Action Plan for Air Quality

		Response	
Event	EI	ER	Contractor
ACTION LEVEL 1. Exceedance for one sample	1. Identify source 2. Inform ER 3. Repeat measurement to confirm finding 4. Increase monitoring frequency to daily	Notify Contractor Check monitoring data and Contractor's working methods	1. Rectify any unacceptable practice 2. Amend working methods if appropriate
Exceedance for two or more consecutive samples	1. Identify source 2. Inform ER 3. Repeat measurements to confirm findings 4. Increase monitoring frequency to daily 5. Discuss with ER for remedial actions required 6. If exceedance continues, arrange meeting with ER 7. If exceedance stops, cease additional monitoring	Confirm receipt of notification of failure in writing Notify Contractor Check monitoring data and Contractor's working methods Discuss with Environmental Supervisor and Contractor on potential remedial actions Ensure remedial actions properly implemented	1. Submit proposals for remedial actions to ER within 3 working days of notification 2. Implement the agreed proposals 3. Amend proposal if appropriate
LIMIT LEVEL 1. Exceedance for one sample	1. Identify source 2. Inform ER 3. Repeat measurement to confirm finding 4. Increase monitoring frequency to daily 5. Assess effectiveness of Contractor's remedial actions and keep the ER informed of the results	1. Confirm receipt of notification of failure in writing 2. Notify Contractor 3. Check monitoring data and Contractor's working methods 4. Discuss with Environmental Team Leader and Contractor potential remedial actions 5. Ensure remedial actions properly implemented	1. Take immediate action and avoid further exceedance 2. Submit proposals for remedial actions to ER within 3 working days of notification 3. Implement the agreed proposals 4. Amend proposal if appropriate
Exceedance for two or more consecutive samples	1. Identify source 2. Inform ER of the causes and actions taken for the exceedance 3. Repeat measurement to confirm findings 4. Increase monitoring frequency to daily 5. Investigate the causes of exceedance 6. Arrange meeting with the ER to discuss the remedial actions to be taken 7. Assess effectiveness of Contractor's remedial actions and keep the ER informed of the results 8. If exceedance stops, cease additional monitoring	1. Confirm receipt of notification of failure in writing 2. Notify Contractor 3. Carry out analysis of Contractor's working procedures to determine possible mitigation to be implemented 4. Discuss amongst Environmental Team Leader and the Contractor potential remedial actions 5. Review Contractor's remedial actions whenever necessary to assure their effectiveness 6. If exceedance continues, consider what portion of the work is responsible and instruct the Contractor to stop that portion of work until the exceedance is abated	1. Take immediate action to avoid further exceedance 2. Submit proposals for remedial actions to ER within 3 working days of notification 3. Implement the agreed proposals 4. Resubmit proposals if problem still not under control 5. Stop the relevant portion of works as determined by the ER until the exceedance is abated.

2.8 Dust Mitigation Measures

The Contractor shall be responsible for the design and implementation of the following dust suppression measures:

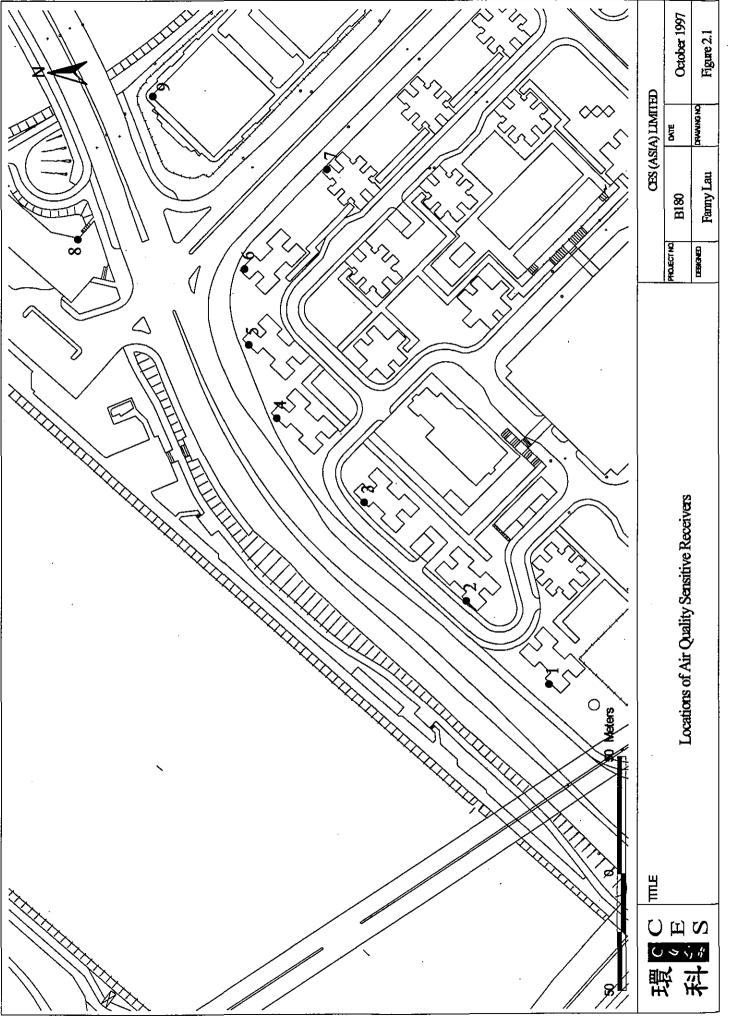

- Periodic watering of open site area;
- Imposition of speed controls for vehicles on unpaved areas, 8 kmh⁻¹ being the limit recommended by EPD;
- If practical, implementation of vehicle wheel and body washing; and
- Deployment of tarpaulin to cover soil which is transported in lorries to and from the work area.

If the above measures are not sufficient to restore the air quality to acceptable levels upon the advice of the ET Leader, the Contractor shall liaise with the ET Leader on alternative mitigation measures, and implement the mitigation measures upon approval by the ER.

3 NOISE

3 NOISE

3.1 Noise Parameters

The construction noise level shall be measured in terms of the A-weighted equivalent continuous sound pressure level (Leq). Leq(30 min) shall be used as the monitoring parameter for the time period between 0700-1900 hours on normal weekdays. Should monitoring be required for any other time periods, Leq(5 min) shall be measured for comparison with the NCO criteria.

As supplementary information for data auditing, statistical results such as L_{10} and L_{90} shall also be obtained for reference. A sample data record sheet is shown in Table 3.3 for reference.

3.2 Monitoring Equipment

Sound level meters, which comply with the International Electrotechnical Commission Publications 651: 1979 (Type 1) and 804: 1985 (Type 1) specifications and acoustic calibrators shall be provided by the Contractor and used for the monitoring of site activities related to this Contract. The accuracy of the sound level meter shall be checked using an acoustic calibrator generating a known sound pressure level at a known frequency, immediately prior to and following each noise measurement. Measurements may be accepted as valid only if the calibration level from before and after the noise measurement are accurate to within 1.0dB.

Noise measurements should not be made in the presence of fog, rain, wind with a steady speed exceeding 5ms⁻¹, or wind with gusts exceeding 10 ms⁻¹. The wind speed shall be checked with a portable anemometer capable of measuring the wind speed in ms⁻¹.

The ET Leader is responsible for the provision of the monitoring equipment. He shall ensure that sufficient noise measuring equipment and associated instrumentation are available for carrying out the baseline monitoring, regular impact monitoring and ad hoc monitoring. All the equipment and associated instrumentation shall be clearly labelled.

3.3 Monitoring Locations

The noise sensitive receivers identified in EIA study are shown in Figure 3.1. Any of these locations would be suitable for noise monitoring. These monitoring locations should not be considered to be contractually binding. Should the contractor find that there are practical reasons for changing these the details should be presented to the ET prior to seeking agreement of the final locations from ER. The status and locations of noise sensitive receivers may change after issuing this Manual. Any alternative monitoring location proposed should be chosen based on whether it is close to the major site activities which are likely to have noise impacts. Should any monitoring site be located in close proximity to the sensitive receiver, care should be taken to avoid disturbance to the occupants during monitoring.

The monitoring station shall normally be at a point 1m from the exterior of the sensitive receivers building facade and be at a position 1.2m above the ground. If there is a problem with access to the normal monitoring position, an alternative position may be chosen, and a correction to the measurements shall be made. For reference, a correction of +3 dB(A) shall be made to the free field measurements. The ET Leader shall agree with the ER on the monitoring position and the corrections adopted. Once the positions for the monitoring stations have been agreed, the baseline monitoring and the impact monitoring shall be carried out at the same positions.

3.4 Baseline Monitoring

As part of the EIA study baseline noise monitoring was carried out in April 1997, the results of which are presented in Appendix A. Nevertheless, further baseline monitoring shall be required prior to the commencement of any works. The ET Leader shall carry out baseline noise monitoring, at all of the sensitive receiver locations indicated in Figure 3.1, prior to the commencement of the construction works relevant to this Contract. The baseline monitoring shall be carried out daily for a period of at least two weeks and a schedule of the baseline monitoring shall be submitted to the ER for approval before the monitoring starts. This monitoring shall include the following:-

- 2 measurements of Leq(30 min) during the time period 0700-1900 (i.e. 30 minutes x 2 occasions x 9 receiver locations = 9 hours total monitoring time)
- 3 consecutive measurements of Leq (5 min) during the period 1900 2300 (i.e. 15 minutes x 9 receiver locations = 2.25 hours total monitoring time)
- 3 consecutive measurements of Leq (5 min) during the period 2300-0700 (i.e. 15 minutes x 9 receiver locations = 2.25 hours total monitoring time)

In exceptional cases, when insufficient baseline monitoring data or questionable results are obtained, the ET Leader shall liaise with the ER to agree on an appropriate set of data to be used as a baseline reference. The nine receiver locations are recommended to include: Belair Garden, Ravana Garden, Shatin City One blocks 3, 4, 5, 6, 13, 14, and 15.

3.5 Impact Monitoring

Noise monitoring shall be carried out, for one 30 minute period three times per week on separate days (i.e. 30 minutes x 2 locations x 3 times per week = 3 hours per week) when there is ongoing construction activity, at a minimum of two locations. These two locations shall be chosen according to which are closest to ongoing construction activities. Additionally, noise monitoring (Leq (30 min)) shall be carried out at the two schools in the vicinity during the school examination periods. The ET Leader shall liaise with the school's personnel and the Examination Authority to ascertain the exact dates and times of all examination periods during the course of the contract.

In case of non-compliance with the construction noise criteria, more frequent monitoring as specified in the Action Plan in Section 3.6 shall be carried out. This additional monitoring shall continue until the recorded noise levels are rectified or proved to be unrelated to the construction activities.

3.6 Event and Action Plan for Noise

The Action and Limit levels for construction noise are defined in Table 3.1. Should non-compliance of the criteria occur, the Action Plan, in Table 3.2., shall be implemented.

Table 3.1 Action and Limit Levels for Construction Noise

Time Period	Action	Limit
0700-1900 hrs on normal weekdays		75* dB(A)
0700-2300 hrs on holidays; and 1900- 2300 hrs on all other days	When one documented complaint is received	60/65/70** dB(A)
2300-0700 hrs on all days		45/50/55** dB(A)

- reduce to 70 dB(A) for schools and 65 dB(A) during school examination periods.
- ** to be selected based on Area Sensitivity Rating.

Table 3.2 Event/Action Plan for Construction Noise

Event	Action ET Leader or ER	n Contractor
Action Level	 Notify Contractor Analyse investigation Require Contractor to propose measures for the analysed noise problem Increase monitoring frequency to check mitigation effectiveness 	Submit noise mitigation proposals to Environmental Team Leader/ Engineer's Representative Implement noise mitigation proposals
Limit Level	Notify Contractor Require contractor to implement mitigation measures. Increase monitoring frequency to check mitigation effectiveness	Implement mitigation measures Prove to Environmental Team Leader ER effectiveness of measures applied

3.7 Noise Mitigation Measures

The EIA report has recommended construction noise control and mitigation measures. The Contractor shall be responsible for the design and implementation of the following measures recommended in the EIA.

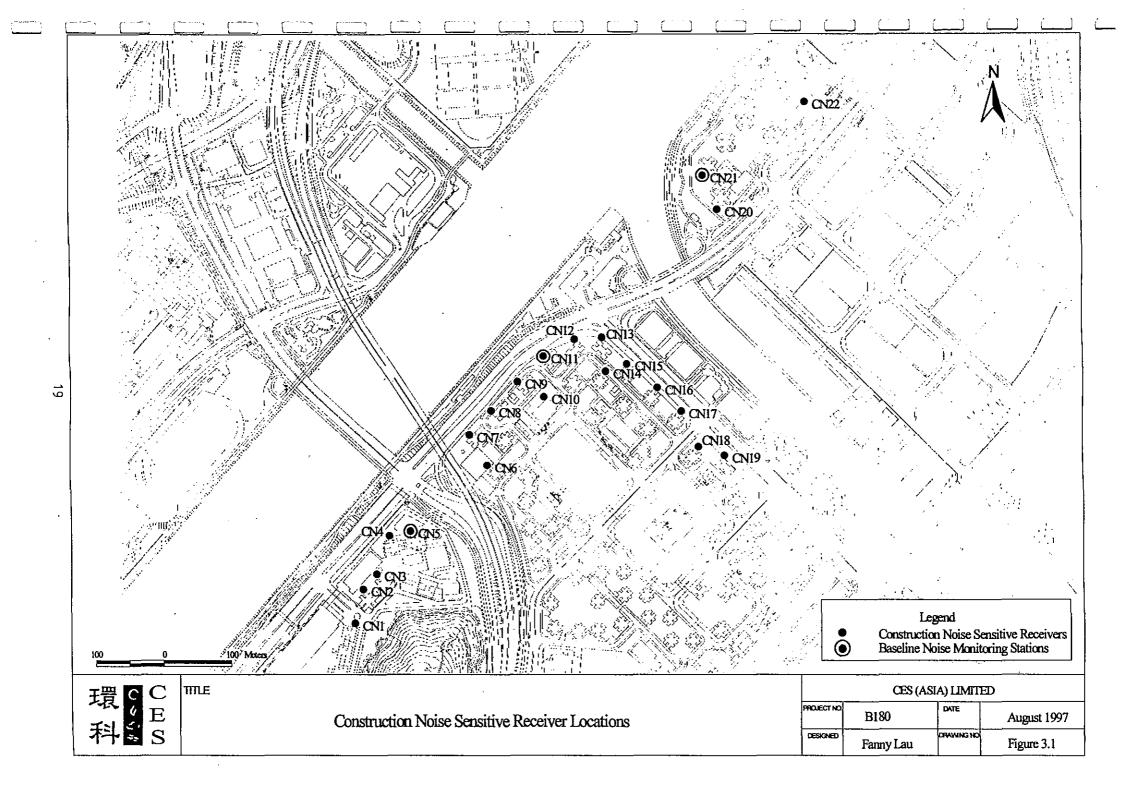

- Use of quietened equipment and screening for all construction works whenever appropriate;
- Construction work to be restricted to normal weekdays, between 0700-1900 hour;
- When night time work is involved, nearby residents should be notified in advance of the
 planned operations and informed of progress. Residents shall be provided with a telephone
 number/contact person with whom they can register complaints concerning noise nuisance;
- Proper location, operation and placing of noisy equipment; and
- Proper programming of construction activities.

If the above measures are not sufficient to restore the construction noise quality to an acceptable level upon the advice of ET Leader, the Contractor shall liaise with the ET Leader on some other mitigation measures, propose any changes to the ER for approval, and carry out the required mitigation measures.

4 WATER QUALITY

4 WATER QUALITY

4.1 Water Quality Parameters

Monitoring for dissolved oxygen (DO), temperature, turbidity, suspended solids (SS), shall be undertaken at designated monitoring stations. The purpose of which is to ensure that any deterioration in water quality can be readily detected and timely action can be taken to resolve any problems. Also monitoring for temperature, pH, SS and oil & grease at the outlets of sedimentation tanks should be carried out. It should be noted that DO, temperature, turbidity and pH should be measured in-situ and the remaining parameters assayed in a laboratory.

In association with the water quality parameters, other relevant data shall also be measured, such as monitoring location/position, time, weather conditions, and any special phenomena and description of work underway at the construction site etc.

4.2 Monitoring Equipment

The following equipment and facilities shall be provided by the Contractor and used for the monitoring of water quality impacts:

4.2.1 Dissolved Oxygen and Temperature Measuring Equipment

- (a) The instrument should be portable and weatherproof using a DC power source. The equipment should be capable of measuring:
 - a DO level in the range of 0-20 mg/l and 0-200% saturation; and
 - a temperature of between 0-45 degree Celsius.
- (b) It should have a membrane electrode with automatic temperature compensation complete with a cable.

4.2.2 Turbidity Measurement Instrument

The instrument should be a portable, weatherproof, and use a DC power source. It should have a photoelectric sensor capable of measuring turbidity between 0-1000 NTU, such as a Hach model 2100P or a similar approved instrument.

4.2.3 Sample Containers and Storage

- (a) Water samples for SS analysis should be stored in high density polythene bottles with no preservative added, packed in ice (cooled to 4°C without being frozen), delivered to the laboratory, and analysed as soon as possible after collection.
- (b) Water samples for oil & grease measurement should be stored in glass bottles, acidified to pH 2 or lower with 1:1 HCl, packed in ice (cooled to 4°C without being frozen), and delivered to the laboratory as soon as possible after collection.

4.2.4 Calibration of In-Situ Instruments

All pH meters, DO meters and turbidimeters shall be checked and calibrated prior to use. DO meters and turbidimeters shall be calibrated by a laboratory accredited under HOKLAS or any other international accreditation scheme, and subsequently re-calibrated at 3 monthly intervals throughout

all stages of the water quality monitoring. Responses of sensors and electrodes shall be checked with certified standard solutions before each use. Wet bulb calibrations for all DO meters shall be carried out before measurement at each monitoring location.

For the on site calibration of field equipment, BS 127:1993, "Guide to field and on-site test methods for the analysis of waters" should be observed.

4.2.5 Laboratory Measurement/Analysis

Analysis shall be carried out in a HOKLAS or other international accredited laboratory. If a site laboratory is set up or a non-HOKLAS or non-international accredited laboratory is hired for carrying out the laboratory analysis, the laboratory equipment, analytical procedures, and quality control shall be approved by the ER.

Sample volume and maximum storage time for each analytical parameter carried out in the laboratory are shown below in Table 4.1

Table 4.1 Water Sample Handling Requirements

Analytical Parameter	Sample Volume Taken (ml)	Storage Temperature	Maximum Storage Time After Sampling
· SS	500	4°C	24 hours
Oil & Grease	1000	4°C	7 days

Each sample shall be analysed in accordance with the APHA Standard Methods for the Examination of Water and Wastewater, 18th edition, or an equivalent method approved by the ER. If in-house or non-standard method is proposed, details of the method verification may be required to be submitted to the ER. In any circumstance, the sample testing shall comply with a comprehensive quality assurance and quality control programme. The laboratory should be prepared to demonstrate the quality programmes to the ER when requested.

4.3 Monitoring Locations

4.3.1 Surface Water

Water quality monitoring should be undertaken at all discharge points from the works area, which are normally outlets of the sedimentation tanks or desilting pits. The actual number of monitoring stations depends on the number of discharge points and may vary as construction proceeds.

4.4 Impact Monitoring

During the course of the construction works, water samples at the discharge points shall be collected three days per week and tested for pH and SS, and sampled once per week for oil and grease analysis.

4.5 Event and Action Plan for Surface Water Quality

All effluent subject to control by the TM are required to be licensed. Therefore, the discharges shall be required to comply with the effluent standard of effluent discharged into Tolo Harbour Coastal Waters and is shown in Table 4.2.

Table 4.2 Selection of Effluent Standards Discharged into Coastal Waters of Tolo Water Control Zone

Measurement Parameter	Effluent Standard
pН	6-9 (pH units)
Suspended solids	30 (mg/l)
Oil & Grease	20 (mg/l)

Source: Technical Memorandum on Effluent Standards, Table 7

4.6 Water Quality Mitigation Measures

The ER and the Contractor shall comply with the Practice Note for Professional Persons with regard to site drainage (ProPECC PN 1/94). Specifically, the following mitigation measures should be undertaken, where applicable, to minimize the impact on water quality during construction:

- Construction of the foundations for the deck above the nullah, and its related flow diversion
 works, should be carried out carefully to prevent contaminants from entering the Nullah.
 Potential impact from activities that would not be protected by sheet piles should be reduced
 by a stringent programme and careful timing of the activities. It is recommended to shorten
 the duration of these activities as much as possible in order to mitigate the impacts;
- For site areas that are close to the Nullah and are not enclosed by sheet piles, it is recommended to construct a silt fence along the boundary of the nullah to trap any silts/ sediments from accidentally entering into the waters of the nullah;
- Before commencing any demolition works, all sewer and drainage connections should be sealed to prevent debris, soil, sand etc. from entering public sewers/drains;
- Site surface runoff should be settled to remove sand/silt before it is discharged into the
 existing storm drains. It is recommended that the sand/silt removal facilities (silt traps,
 sediment basins) and oil interceptors should be carefully planned to ensure that they would
 be installed at appropriate locations to capture all surface water generated on site. It is also
 recommended that, where necessary, temporary catchpits and perimeter channels be
 constructed in addition to the existing channel system within the site prior to the site
 formation works and earthworks;
- Wastewater generated from concreting, cleaning of works and similar activities should not be discharged into the stormwater drains. It is recommended this wastewater should be discharged into foul sewers, after the removal of settleable solids, and pH adjustment as necessary;

- Sand traps, oil interceptors and other pollution prevention installations should be properly cleaned and maintained;
- Open stockpiles should be covered with tarpaulin or similar materials to avoid weather
 erosion which may wash fines into stormwater during the wet season, and prevent dust
 arisings during the dry season;
- Any wash-water from the wheel washing basins located at each site exit should have sand and silt settled out before discharging into storm drains; and
- All fuels should be stored in bunded areas such that spillage can be easily collected;

With the above mitigation measures properly undertaken, the potential water quality impact of the scheme should be local and minimal.

Table 4.3 Event and Action Plan for Surface Water Quality

Event	ET Leader	Contractor	ER .
Limit level being exceeded by one sampling day	1. Repeat in-situ measurement to confirm findings; 2. Identify source(s) of impact; 3. Inform contractor; 4. Check monitoring data, all plant, equipment and Contractor's working methods; 5. Discuss mitigation measures with ER and Contractor; 6. Ensure mitigation measures are implemented; and 7. Increase the monitoring frequency to daily until no exceedance of Limit level.	1. Inform the Engineer and confirm notification of the non-compliance in writing; 2. Rectify unacceptable practice; 3. Check all plant and equipment; 4. Consider changes of working methods; 5. Propose mitigation measures to ER within 3 working days and discuss with ET and ER; and 6. Implement the agreed mitigation measures.	1. Discuss with ET and Contractor on the proposed mitigation measures; 2. Request Contractor to critically review the working methods; 3. Make agreement on the mitigation measures to be implemented; and 4. Assess the effectiveness of the implemented mitigation measures.
Limit level being exceeded by more than two consecutive sampling days	1. Repeat in-situ measurement to confirm findings; 2. Identify source(s) of impact; 3. Inform contractor; 4. Check monitoring data, all plant, equipment and Contractor's working methods; 5. Discuss mitigation measures with ER and Contractor; 6. Ensure mitigation measures are implemented; and 7. Increase the monitoring frequency to daily until no exceedance of Limit level for two consecutive days.	1. Inform the Engineer and confirm notification of the non-compliance in writing; 2. Rectify unacceptable practice; 3. Check all plant and equipment; 4. Consider changes of working methods; 5. Propose mitigation measures to ER within 3 working days and discuss with ET and ER; 6. Implement the agreed mitigation measures; and 7 As directed by the Engineer, to slow down or to stop all or part of the marine work or construction activities.	1. Discuss with ET and Contractor on the proposed mitigation measures; 2. Request Contractor to critically review the working methods; 3. Make agreement on the mitigation measures to be implemented; 4. Assess the effectiveness of the implemented mitigation measures; and 5. Consider and instruct, if necessary, the Contractor to slow down or to stop all or part of the marine work until no exceedance of Limit level.

5 SITE ENVIRONMENTAL AUDIT

5 SITE ENVIRONMENTAL AUDIT

5.1 Site Inspections

Site inspections provide a direct means to trigger and enforce specified environmental protection and pollution control measures. The ER, ET and Contractor shall cooperate by following a site inspection procedure. The deployment of a routine set inspection procedure will assist in checking the, implementation of the appropriate environmental protection and pollution control mitigation measures, and the existence of deficiencies that will trigger the action and limit requirements.

The ET Leader is responsible for the formulation of the environmental site inspection, establishment of the deficiency and action reporting system, and for carrying out the site inspection works. The proposal for site inspection shall be submitted to the Contractor for agreement and to the ER for approval within 21 days of the construction contract commencement and will include details of the site inspection logistics, and the deficiency and action reporting procedures.

Site inspections shall be carried out at least once per week and the areas of inspection shall not be limited to the environmental situations, pollution control and mitigation measures within the site. The inspection shall also review the environmental situations outside the site area, which are likely to be affected, directly or indirectly, by the site activities. The ET Leader shall make reference to the following information in conducting the inspection:

- EIA recommendations on environmental protection and pollution control mitigation measures;
- works progress and programme;
- individual works methodology proposals (which shall include proposals of associated pollution control measures);
- the contract specifications on environmental protection;
- the legal framework regarding relevant environmental protection and pollution control requirements; and
- previous site inspection information.

The Contractor shall be required to inform the ET Leader of all relevant information relating to the construction contract in order for him to carry out the site inspections effectively. The inspection results and associated recommendations on improvements to the environmental protection and pollution control works shall be submitted to the ER and the Contractor within 24 hours. Thus ensuring that all parties are informed of any deteriorating environmental condition so that immediate action can be taken. The Contractor shall follow the procedures and time-frame stipulated in the environmental site inspection, deficiency and action reporting system formulated by the ET Leader, and shall report any remedial measures following the site inspections:

Ad hoc site inspections shall also be carried out if significant environmental problems are identified. Inspections may also be required subsequent to receipt of environmental complaints, or as part of the investigation work, as specified in the Action Plan for environmental monitoring and audit.

5.2 Compliance with Legal and Contractual Requirements

In addition to the environmental protection and pollution control laws in Hong Kong there are contractual environmental protection and pollution control requirements which the construction activities shall comply with.

In order that the works are in compliance with the contractual requirements, all the works method statements submitted by the Contractor to the ER for approval shall be sent to the ET Leader for vetting to check whether sufficient environmental protection and pollution control measures have been included.

The ET Leader shall also review the progress and programme of the works to ensure that relevant environmental laws have not been violated, and any foreseeable potential for violating the laws can be prevented.

The Contractor shall regularly copy relevant documents to the ET Leader so that the checking work can be carried out. The documents shall at least include the updated Work Progress Reports, the updated Works Programme, the application letters for the various licence/permits under the environmental protection laws, and all the valid licence/permit. A site diary shall also be made available for the ET Leader's inspection upon his request.

After reviewing the document, the ET Leader shall advise the ER and the Contractor of any non-compliance with the contractual and legislative requirements on environmental protection and pollution control for them to take follow-up actions. If the ET Leader's review concludes that the current status on licence/permit application and any environmental protection and pollution control preparation works may not cope with the works programme or may result in potential violation of environmental protection and pollution control requirements by the works in due course, he shall advise the Contractor and the ER accordingly.

Upon receipt of the advice, the Contractor shall undertake immediate action to remedy the situation. The ER shall follow up to ensure that appropriate action has been taken by the Contractor in order that the environmental protection and pollution control requirements are fulfilled.

5.3 Environmental Complaints

Complaints shall be referred to the ET Leader who shall initiate the complaint investigation procedure. The Complaints Procedure, actioned by the ET Leader shall include the following:

- log complaint and date of receipt onto a complaint database;
- investigate the complaint to determine its validity, and to assess whether the source of the problem is due to works activities;
- if a complaint is valid and due to site activities, identify the source of the problem;
- identify mitigation measures if required and advise the Contractor accordingly;
- review and check the Contractor's response to the recommended mitigation measure;
- investigate all stages of remedial work and update relevant parties on the resultant situation;
- if the complaint was referred by EPD, inform EPD on the status of the complaint investigation and the follow-up action within the time frame assigned by EPD;

6 REPORTING

6 REPORTING

6.1 General

Report presentation methods shall be agreed with the ER, which may be in the format of an electronic medium. The following reports shall be provided by the Contractor:

- Baseline monitoring report;
- Monthly EM&A reports; and
- Quarterly EM&A summary report.

These reports shall be submitted to the following parties, in the form agreed with the ER, through the Environmental Auditing Team. The number of copies are subject to review by the ER:

- Highways Department (1 copy);
- Contractor (1 copy);
- Environmental Auditing Team (1 copy); and
- Environmental Protection Department (3 copies).

6.2 Baseline Monitoring Report

A Baseline Environmental Monitoring Report shall be prepared and submit by the ET Leader within 10 working days of completion of the baseline monitoring. Copies of the Baseline Environmental Monitoring Report shall be submitted to each of the two parties: the Contractor, and the Client Department. The ET Leader shall liaise with the relevant parties on the exact number of copies required.

The baseline monitoring report shall include at least the following:

- (a) up to half a page executive summary;
- (b) brief project background information;
- (c) drawings showing locations of the baseline monitoring stations;
- (d) monitoring results (in both hard and diskette copies) together with the following information:
 - monitoring methodology;
 - equipment used and calibration details;
 - parameters monitored;
 - monitoring locations (and depth); and
 - monitoring date, time, frequency and duration.
- (e) details on influencing factors, including:
 - major activities, if any, being carried out on the site during the period;
 - weather conditions during the period; and
 - other factors which might affect the results.
- (f) determination of the Action and Limit Levels for each monitoring parameter and statistical analysis of the baseline data;
- (g) revisions for inclusion in the EM&A Manual; and
- (h) comments and conclusions.

6.3 Monthly EM&A Reports

The results and findings of all EM&A work required in the Manual shall be recorded in the monthly EM&A reports prepared by the ET Leader. The EM&A report shall be prepared and submitted within 10 working days of the end of each reporting month, with the first report due in the month after construction commences. Each monthly EM&A report shall be submitted to the Client Department and the Contractor. Before submission of the first EM&A report, the ET Leader shall liaise with the parties on the exact number of copies and format of the monthly reports.

The ET leader shall review, every 6 months or on a as needed basis, the number and location of monitoring stations and parameters of monitor. This is to ensure incorporation of any changes in the surrounding environment and nature of works in progress.

6.3.1 First Monthly EM&A Report

The first monthly EM&A report shall include at least the following:

- (a) 1-2 pages executive summary;
- (b) basic project information including a synopsis of the project organisation, programme and management structure, and the work undertaken during the month;
- (c) a brief summary of EM&A requirements including:
 - all monitoring parameters;
 - environmental quality performance limits (Action and Limit levels);
 - Event-Action Plans;
 - environmental mitigation measures, as recommended in the project EIA study final report;
 - environmental requirements in contract documents;
- (d) advice on the implementation status of environmental protection and pollution control/mitigation measures, as recommended in the project EIA study report, summarised in the updated implementation schedule;
- (e) drawings showing the project area, any environmental sensitive receivers and the locations of the monitoring and control stations;
- (f) monitoring results (in both hard and diskette copies) together with the following information;
 - monitoring methodology
 - equipment used and calibration details
 - parameters monitored
 - monitoring locations (and depth)
 - monitoring date, time, frequency, and duration;
- (g) graphical plots of trends of monitored parameters over the past four reporting periods for representative monitoring stations annotated against the following:
 - major activities being carried out on site during the period;
 - weather conditions during the period; and
 - any other factors which might affect the monitoring results;
- (I) a summary of non-compliance (exceedances) of the environmental quality performance limits (Action and Limit levels);
- a review of the reasons for and the implications of non-compliance including review of pollution sources and working procedures;
- (k) a description of the actions taken in the event of non-compliance and deficiency reporting and any follow-up procedures related to earlier non-compliance;

- (I) a summary record of all complaints received (written or verbal) for each media, including locations and nature of complaints, liaison and consultation undertaken, actions and follow-up procedures taken and summary of complaints; and
- (m) An account of the future key issues as reviewed from the works programme and work method statements.

6.3.2 Subsequent EM&A Reports

The subsequent monthly EM&A reports shall include the following:

- (a) Title Page
- (b) Executive Summary (1-2 pages)
 - Breaches of action and limit levels
 - Complaint Log
 - Reporting Changes
 - Future potential key issues
- (c) Contents Page
- (d) Environmental Status
 - Drawing showing the project area, any environmental sensitive receivers and the locations of the monitoring and control stations
 - Summary of non-compliance with the environmental quality performance limits
 - Summary of complaints
- (e) Environmental Issues and Actions
 - Review key issues carried forward and any follow-up procedures related to earlier non-compliance (complaints and deficiencies)
 - Description of the actions taken in the event of noncompliance and deficiency reporting
 - Recommendations (should be specific and target the appropriate party for action)
 - Implementation status of the mitigatory measures and the corresponding effectiveness of the measures
- (f) Anticipated Future Key Issues
- (g) Appendix
 - Action and Limit levels
 - Graphical plots of trends of monitored parameters at key stations over the past four reporting periods for representative monitoring stations annotated against the following:
 - I) major activities being carried out on site during the period;
 - ii) weather conditions during the period; and
 - iii) any other factors which might affect the monitoring results
 - Monitoring schedule for the present and next reporting period
 - Cumulative complaints statistics
 - Details of complaints, outstanding issues and deficiencies

6.4 Quarterly EM&A Summary Reports

The quarterly EM&A summary report which should generally be around 5 pages in total and contain at least the following information:

(a) up to half a page executive summary;

- (b) basic project information including a synopsis of the project organisation, programme, contacts of key management, and a synopsis of work undertaken during the quarter;
- (c) a brief summary of EM&A requirements including:
 - monitoring parameters;
 - environmental quality performance limits (Action and Limit levels); and
 - environmental mitigation measures, as recommended in the project EIA study final report;
- (d) advice on the implementation status of environmental protection and pollution control/mitigation measures, as recommended in the project EIA study report, summarised in the updated implementation schedule;
- (e) drawings showing the project area, any environmental sensitive receivers and the locations of the monitoring and control stations;
- (f) graphical plots of the trends of monitored parameters over the past 4 months (the last month of the previous quarter and the present quarter) for representative monitoring stations annotated against;
 - the major activities being carried out on site during the period;
 - weather conditions during the period; and
 - any other factors which might affect the monitoring results;
- (g) advice on the solid and liquid waste management status;
- (h) a summary of non-compliance (exceedances) of the environmental quality performance limits (Action and Limit levels);
- (I) a brief review of the reasons for and the implications of non-compliance including review of pollution sources and working procedures;
- (j) a summary description of the actions taken in the event of non-compliance and any follow-up procedures related to earlier non-compliance;
- (k) a summary record of all complaints received (written or verbal) for each media, liaison and consultation undertaken, actions and follow-up procedures taken;
- (l) comments (e.g. effectiveness and efficiency of the mitigation measures), recommendations (e.g. any improvement in the EM&A programme) and conclusions for the quarter; and
- (m) proponents' contacts and any hotline telephone number for the public to make enquiries.

6.5 Data Keeping.

Site documents such as the monitoring field records, laboratory analysis records, site inspection forms, etc. are not required to be included in the monthly EM&A reports for submission. However, the documents shall be well kept by the ET Leader and be ready for inspection upon request. All relevant information shall be clearly and systematically recorded in the documents. The monitoring data shall also be recorded in magnetic media form, and the software copy available upon request. All the documents and data shall be kept for at least one year after completion of the construction contract.

6.6 Interim Notifications of Environmental Quality Limit Exceedances

With reference to Event/Action Plans in Tables 2.2 and 3.2, when the environmental quality limits are exceeded, the ET Leader shall immediately notify the ER. The notification shall be followed up with information regarding the outcome of the investigation; proposed action; and the success of the action taken, with any necessary follow-up proposals. A sample template for the interim notifications is shown in Table 6.1.

APPENDIX A - BASELINE

BASELINE MONITORING RESULTS

APPENDIX A: BASELINE MONITORING FOR NOISE AND DUST

1 BASELINE NOISE MONITORING

1.1 Noise Monitoring Locations

Monitoring locations were selected to reflect the noise levels of Noise Sensitive Receivers in the vicinity by interpolation. Three noise stations were chosen for this baseline study. The locations are shown on Figure A1. Each sampling location was exposed to the ambient traffic noise. Station A (City One) and Station B (Belair Garden) are exposed to traffic noise predominantly from Tai Chung Kiu Road and Station C (Ravana Garden) is exposed to traffic noise mainly from Siu Lek Yuen Road.

1.2 Instrumentation and Calibration

Baseline measurements were conducted using a Brüel & Kjær (B&K) 2231 integrating sound level meter stations A and B and B&K 2236 integrating sound level meter for station C. These meters complied with the International Electrotechnical Commission Publications IEC 651:1979 (Type 1) and 804:1985 (Type 1).

The sound level meters were calibrated with a B&K Type 4231 sound level calibrator with a sound pressure level 93.8 dB at 1 kHz before and after each measurement, ensuring that the noise measurements agreed within 1 dB. Noise measurements were taken in terms of the A-weighted equivalent continuous sound pressure level (L_{eq}) over a period of 30 minutes. The sound level meters were supported at a position of 1.2m above ground by a tripod.

1.3 Monitoring Schedule

Baseline noise monitoring was conducted as part of the EIA study and commenced on 7 April 1997 and ended on the 21 April 1997 (there was no survey on the 10 April due to rain). The measurements were carried out between the hours of 0900 and 1630. Only daytime monitoring was conducted because there were no plans to carry out construction works in the evening or night time. However, should the construction programme require works to take place in these time periods it shall be necessary to conduct additional baseline monitoring of noise before any works commence.

1.4 Results

Baseline noise measurements were mainly influenced by road traffic noise from Tai Chung Kiu Road and Siu Lek Yuen Road. The measurements taken at Ravana Gardens on 13, 14 and 16 April 1997 were also influenced by helicopter noise. The monitoring results are presented in Table A1- A3.

Table A1 Baseline Monitoring Results at City One - Station A

Table A4 Baseline Noise Levels, dB(A) - Summary

	Noise Level, (dB(A))						
Monitoring Location	Max	Min					
City One, Block 6	74.9	70.9					
Belair Garden, Podium	74.6	66.4					
Ravana Garden, Podium	64.0	61.8					

2 BASELINE DUST MONITORING

2.1 Instrumentation and Calibration

One GMWS-2310 ACCU-VOL high volume sampler with associated equipment, calibration kit and shelter in accordance with *Part 50 of Chapter 1 appendix B of Title 40 of the Code of Federal Regulations of the USA* was used for dust (Total Suspended Particulates (TSP)) levels determination.

2.2 Methodology

One monitoring location on the ground floor of Sha TinCity One Block 5 was chosen and is shown on Figure A2. The major potential air quality impact during the construction phase will be dust arising from haul road emissions, open site erosion, excavation and filling operations. Baseline air quality monitoring was carried out as part of the EIA study, well before any construction activities were started. The TSP levels were measured by "High Volume Method for Total Suspended Particulates" as described by the United States Environmental Protection Agency in 10 CFR Part 50.

The sampling filters were weighed on an analytical balance (after moisture calibration in the desiccator) both before and after sampling to determine the net dust weight. The total air volume sampled, corrected to standard conditions, were determined from he measured flow rates and duration of the sampling period. Ambient air TSP concentrations were then calculated from the mass of the collected particles divided by the volume of air sampled, corrected to standard conditions. Totals were expressed in micrograms per cubic metre.

2.3 Monitoring Schedule

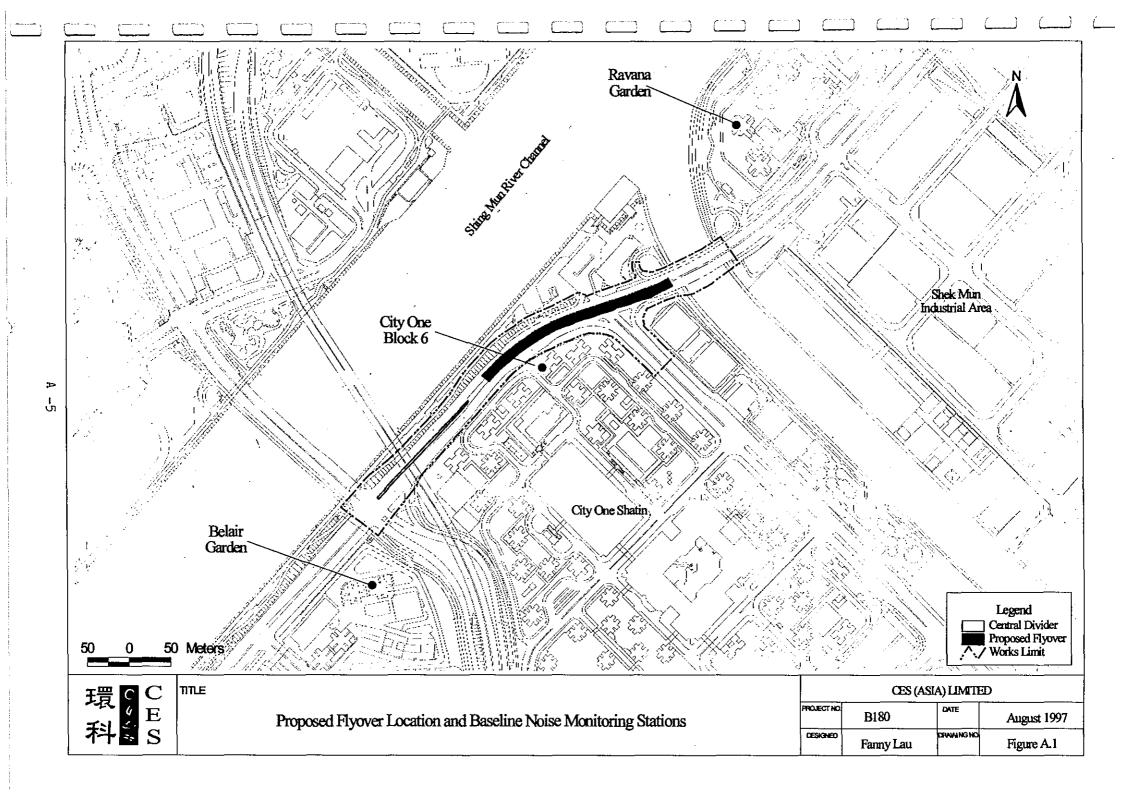

Monitoring was carried out over a 24-hour period from 7 April 1997 to 22 April 1997 (except the 10 April which was cancelled due to heavy rainfall).

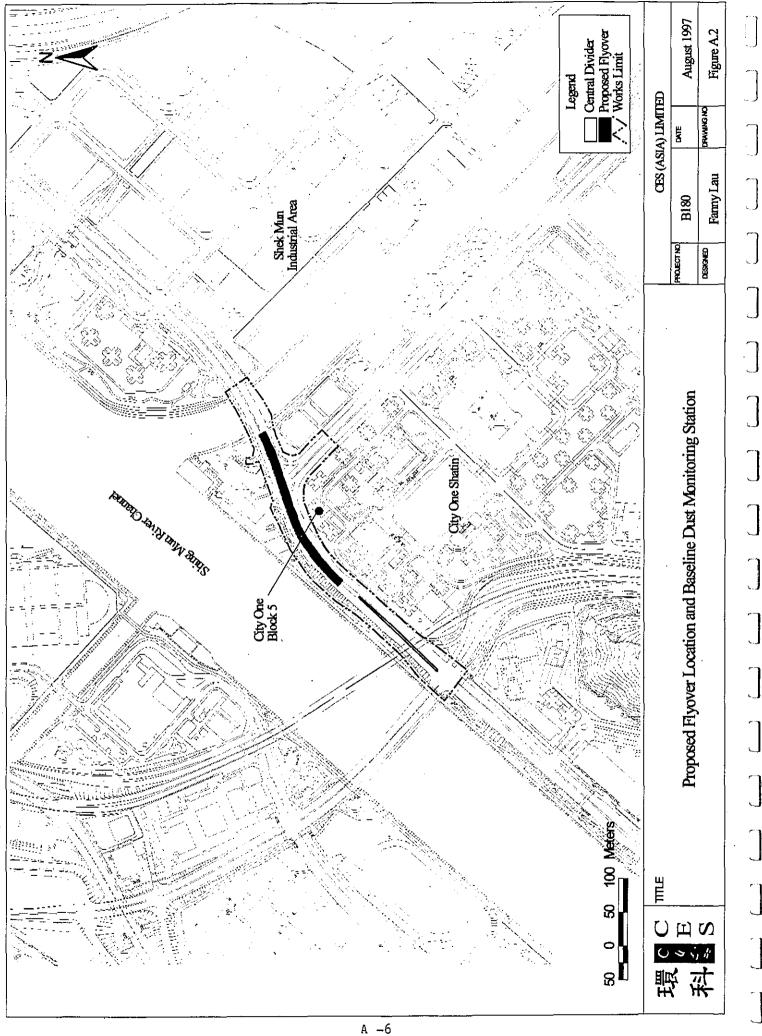

2.4 Results

TSP levels were measured at one location for 24-hour periods on 14 dates, the results are presented in Table A5.

APPENDIX B - LEGISLATIVE FRAMEWORK

APPENDIX B: BASELINE MONITORING LEGISLATIVE FRAMEWORK

1 Construction Noise

The Noise Control Ordinance provides for the control of construction noise. Assessment procedures and standards are set out in two Technical Memoranda associated with the NCO: the *Technical Memorandum on Noise from Construction Work other than Percussive Piling* and the *Technical Memorandum on Noise from Percussive Piling*.

Under the existing provisions, there is no legal restriction on noise generated by construction activities (other than percussive piling) between the hours of 07.00 and 19.00 on normal weekdays. However, EPD's Practice Note for Professional Persons PN 2/93 sets a non-statutory daytime noise limit of 75 dB(A) $L_{\rm eq}$ (30 min) at the facades of dwellings, and 70 dB(A) at the facades of schools (65 dB(A) during examinations).

2 Construction Dust

The Air Pollution Control Ordinance (APCO) provides powers for controlling air pollutants from a variety of stationary and mobile sources, including fugitive dust emissions from construction sites. It encompasses a number of Air Quality Objectives (AQO) which stipulate concentrations for a range of pollutants. The AQO for total suspended particulates (TSP) which are relevant to this study are tabulate in Table B1.

Table B1 Hong Kong Air Quality Objectives

A. D. Water L	Maximum Average Concentration (µgm ⁻³) ¹							
Air Pollutant	1-Hour	24-Hour ²	Annual ³					
TSP	500⁴	260	80					

- Measured at 298 K and 101.325 kPa.
- Not to be exceeded more than once per year.
- 3 Arithmetic mean.
- ⁴ Not AQO.

In addition to the above established legislative controls, it is generally accepted that an hourly average TSP concentration of $500 \, \mu gm^3$ should not be exceeded. Such a control limit is particularly relevant to construction work and has been imposed on a number of construction projects in Hong Kong in the form of contract clauses.

For construction dust, it is standard practice to use a TSP limit in air over a 1-hour period of $500 \, \mu gm^{-3}$. The maximum acceptable TSP concentration averaged over a 24-hour period is $260 \, \mu gm^{-3}$, as defined in the Air Quality Objectives (AQOs).
