Appendix 5.3 Pollution Loading Inventory

1 INTRODUCTION

1.1 The pollution loading inventory was compiled for the storm and sewage outfalls within the whole Hong Kong waters for input into the Update Model and the detailed Victoria Harbour (VH) Model for two time horizons, namely 2011 and 2016 respectively, for cumulative impact assessment. The methodologies for compiling the pollution loading are given in this Appendix.

2 STORM OUTFALLS

- 2.1 The key sources of water pollution in storm outfalls include:
 - Pollution due to sewage from unsewered developments (dry weather load)
 - Pollution due to expedient connections from trade and residential premises, and integrity problems of aged drainage and sewerage systems (dry weather load)
 - Pollution due to livestock waste (dry weather load)
 - Rainfall related load.
- 2.2 The total pollution load discharged via the storm system would cover the dry weather load and rainfall related load

Dry Weather Load

- 2.3 Domestic, commercial and industrial activities are the principle sources of dry weather load in storm drains. Total pollution loads generated from these activities were compiled by catchment areas as shown in **Figure A5-3-1** below with reference to the projected population and employment data provided by the Planning Department (PlanD). Details of these planning data and the methodology for calculating the pollution loads from domestic commercial and industrial activities are given in Section 4 of this Appendix.
- 2.4 It was assumed that a portion of total pollution load generated within a catchment would be lost to the storm system whilst the rest of the flow would be diverted to the sewerage system. The assumed percentages of pollution load discharged into the storm system for different catchments are presented in Table A5-3-1.

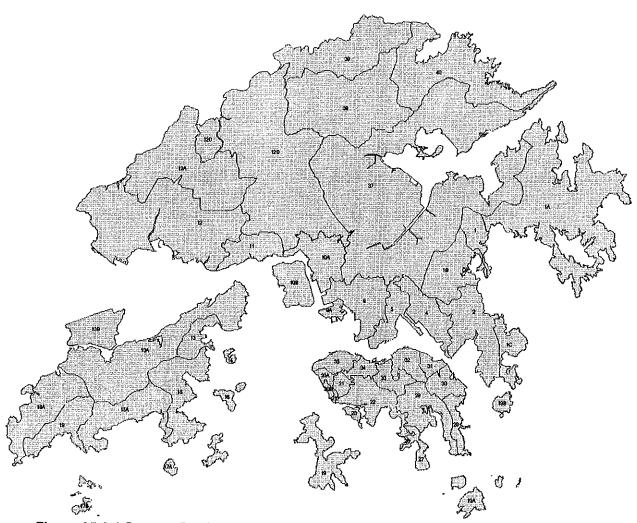

Figure A5-3-1 Sewage Catchment Boundaries

Table A5-3-1 Assumed % of Pollution Load in the Storm System for 2011 and 2016

- 2.5 The percentage interceptions assumed in **Table A5-3-1** were based on the implementation schedule for sewerage improvement projects as adopted under the EPD Update (CE42/97) and the HATS EEFS (CE42/2001).
- 2.6 The pollution loading in the storm system contributed from domestic, commercial and industrial activities was compiled to the catchment levels shown in **Figure A5-3-1**. The pollution loading compiled for each catchment was distributed to appropriate discharge points (i.e. storm culverts / outfalls, rivers and nullahs). It was assumed that these storm pollutions would be evenly distributed amongst the major storm water discharge points within the catchment.
- 2.7 The livestock waste load discharged via rivers / streams adopted under the EPD Update Study

(CE42/97) as shown in Table A5-3-2 was directly applied in this EIA for 2011 and 2016.

Table A5-3-2 Livestock Waste Load Assumed for 2011 and 2016

Catchment	River Name	Flow (m³/d)	SS (kg/d)	TKN (kg/d)	NH₃-N (kg/d)	TP (kg/d)	<i>E.coli</i> (counts/d)
Tsueng Kwan O	Tseng Lan Shue River	2	0	0	0	0	6.98E+11
Sheung Shui and Fanling	Shenzhen River	3216	363	41	22	18	9.28E+14
Yuen Long, Tin	Shan Pui Ho River	5034	568	65	34	28	1.45E+15
Shui Wai and Kam Tin	Tin Shui Wai Nullah	4190	473	54	28	24	1.21E+15
Deep Bay	Sheung Pak Nai Stream	97	11	1	1	1	2.79E+13
Deep bay	Ha Pak Nai Stream	677	76	9	5	4	1.95E+14

2.8 The total dry weather load in the storm outfall would include the loading contributed from domestic, commercial and industrial activities and the loading from livestock discharges (if any) as shown in **Table A5-3-2**.

Rainfall Related Load

2.9 It was assumed that a rainfall volume of greater than 10mm per day (and rainfall intensity greater than 2mm/hr) would give rise to runoff. The runoff percentage was based on the average rainfall data between 1/01/74 and 31/10/05 from the Hong Kong Observatory. The calculation of the runoff percentage is shown below:

Runoff percentage = (Sum of the rainfail volume for the days with rainfall volume > 10mm and intensity > 2mm/hr within the season) ÷ Total rainfall volume for the season x 100%

- 2.10 Rainfall data from May to September represent the values for wet season, and those from November to March represent the values for dry season. Accordingly, the runoff percentage was calculated as 93% and 70% for wet and dry seasons respectively
- 2.11 The 30-year long term average rainfall data were used to determine the daily runoff value as shown below:

Daily runoff value (m/day) = 30year long term average daily rainfall data x runoff percentage

- 2.12 Thus, the runoff value was calculated as 0.01104 m/day and 0.00102 m/day for wet and dry seasons respectively.
- 2.13 The amount of rainfall related load that would be discharged into the sea depends on the amount of impermeable area within each catchment. It was assumed that all urbanized/developed areas within the catchment would be impermeable. The daily volume of runoff generated within each catchment was estimated as shown below:

Daily volume of runoff in each catchment (m³/day)

- = daily runoff value (m/day) x impermeable area within each catchment (m²)
- 2.14 The daily volume of runoff estimated for each catchment was multiplied with the runoff concentrations to derive the rainfall related loading. The assumed runoff concentrations are shown in **Table A5-3-3**.

Table A5-3-3 Event Mean Concentrations for Stormwater Runoff

TSS	BOD ₅	NH₃N	Cu	TP	OrthoP	Silicate	TON	TKN
(g/m³)	(g/m ³)	(g/m³)	(g/m³)	(g/m³)	(g/m³)	(g/m³)	(g/m³)	(g/m³)
43.25	22.48	0.20	0.01	0.20	0.04	3.28	0.40	1.40

(Source: EPD Pilot Study of Stormwater Pollution)

2.15 The rainfall related loading was compiled to the catchment levels shown in **Figure A5-3-1**. The pollution loading compiled for each catchment was distributed to appropriate discharge points (i.e. culverts, outfalls, rivers and nullahs). It was assumed that the rainfall related loading was evenly distributed amongst the major storm water discharge points within the catchment.

3 SEWAGE OUTFALLS

- 3.1 A portion of the total loads from domestic, commercial and industrial activities generated in each catchment was allocated to the sewerage system according to the percentage of storm interception shown in Table A5-3-1. The remaining portion of the total load in each catchment was distributed to the storm system.
- 3.2 Besides the pollution loads from domestic, commercial and industrial activities, the sewerage system would also receive pollution loads from landfills and beaches as most of the landfill sites and beach facilities would be connected to the sewerage system. **Table A5-3-4** and **Table A5-3-5** show the pollution load of relevant landfills and beaches adopted under the EPD Update Study. These loading data were directly adopted in this EIA for 2011 and 2016. The beach loading was included for the wet season simulations only. Loading from landfills and beaches that would not be connected to the STW is given in Section 6 of this Appendix. It is considered that the effect of this point source pollution loading would be localized. Contributions of these point source pollution loads would be insignificant as compared to the overall pollution loading that would be discharged into the sea. Possible change of these point source loads would unlikely affect the overall modelling results. Thus, the broad assumption of using the same amount of point source pollution loads for all the assessment years is considered acceptable.

Table A5-3-4 Pollution Flows and Loads from Landfills

Table A5-3-6 shows the treatment processes for major STW. It should be noted that SCISTW, Pillar Point Sewage Treatment Works (PPSTW), Siu Ho Wan Sewage Treatment Works (SHWSTW), Tolo Harbour Effluent Export Scheme (THEES), North West New Territories (NWNT) outfall and Sham Tseng Sewage treatment Works (SHTSTW) are not included in Table A5-3-6 as loading discharged from these STW were compiled separately based on the information from recent EIA studies and actual measurements. The treatment efficiencies for different treatment processes are given in Table A5-3-7 for reference. The loading discharged from HATS has been considered separately as shown in Table 5.14 of the main EIA text based on the information provided in the Final Study Report of the EEFS.

Chemical Enhanced Primary Treatment (with no disinfection) ⁸	55%	70%	10%	45% ^C	60%	60%	80%	50%
Chemical Enhanced Primary Treatment (with disinfection) ⁸	55%	70%	10%	45% ^C	60%	60%	80%	99.95%
Secondary Treatment (no disinfection)	85%	90%	75%	80%	35%	50%	74%	94%
Secondary Treatment (with disinfection)	85%	90%	75%	80%	35%	50%	74%	99.97%

Note

- A. It is assumed that the reduction of the pollution parameters is insignificant in screening plants. Therefore, the removal rates for these parameters were all assumed zero.
- B. Based on estimation from the SSDS EIA Study: Technical Note 1 (Revised) Wastewater Flows and Loads and Effluent Characteristics. The loading discharged from HATS has been considered separately as shown in Table 5.14 of the main EIA text based on the information provided in the Final Study Report of the EEFS.
- C. The removal rate of org-N is calculated from the removal rates of NH₃-N and total N (10% and 25% respectively) assuming that NH₃-N contributes about 57% of total N in raw sewage.

4 POLLUTION LOADS FROM DOMESTIC, COMMERCIAL AND INDUSTRIAL ACTIVITIES

Population and Employment Statistics

Time Aspect

4.1 The 2003-based Territorial Population and Employment Data Matrices (TPEDM), which are the latest planning information released by PlanD at the time when this assessment was conducted, were used to compile the pollution loads from domestic, commercial and industrial activities. The TPEDM provides the projected population breakdown by Planning Vision and Strategy (PVS) zones for 2006, 2011 and 2016. For strategic planning purposes, two different scenarios of growth rate are postulated

for future population (2011 and 2016) under the 2003-based TPEPM. Scenario I assumed a total population of 7.57 million by 2016. Scenario II assumed a total population of 7.94 million by 2016, which represents about 5% increase in population on top of Scenario I. The population and employment projections for 2006 are only available for Scenario I.

- 4.2 Territorial population projections given by the Census & Statistics Department (C&SD) were used as the control totals for the TPEDM Scenario I. The TPEDM Scenario II was compiled for long-term planning purposes with no given territorial population as the control totals and was used in this EIA for conservative assessment.
- 4.3 The modeling work was carried out for two time horizons, namely 2011 and 2016 and the projected population data provided by PlanD at PVS zones are also available for 2011 and 2016. The population for 2011 and 2016 was calculated using the TPEDM Scenario II for 2011 and 2016.

Spatial Aspect

4.4 To facilitate the estimation of pollution loading, the population and employment data are required to be presented at the level of catchment areas shown in Figure A5-3-1 of this Appendix. However, the projected population from PlanD is provided in a much smaller scale at PVS zones. Population and employment data for each sewage catchment area were estimated by overlaying the PVS zones on top of the layout of the sewage catchment area for allocating the appropriate PVS zones to the sewage catchment area.

Data Manipulation

- 4.5 The TPEDM provides the number of usual residents, mobile residents and school places within the territory at PVS zones.
- 4.6 Employment population is divided by 12 job types under the TPEDM as listed below:
 - J1 Manufacture
 - J2 Electricity, gas & water
 - J3 Transport, storage & communication
 - J4 Wholesale and retail
 - J5 Import & export
 - J6 Financial, insurance, real estate & business services
 - J7 Agriculture & fishery
 - J8 Mining & quarrying
 - J9 Construction
 - J10 Restaurants, hotels & boarding houses
 - J11 Community, social & personal services
 - J12 Public administration
- 4.7 The population data from the TPEDM were manipulated and presented at the following categories:
 - Residential population (by usual residents and mobile residents)
 - Transient Population (by total employment number and total school places), where total employment =J1+J2+J3+J4+J5+J6+J7+J8+J9+J10+J11+J12
 - Number of employees in commercial sector (by J2, J3, J4, J9, J10 & J11)
 - Number of employees in manufacturing sector (=J1) by 6 sub-categories, namely food, textiles, leather, paper, manufacturing and machinery respectively.
- The domestic pollution load to be generated from a catchment would be affected by the number of resident population and transient population within the catchment. The total employee number comprises 12 job types listed above. It is considered that commercial effluents are contributed from job J2 to J4 and J9 to J11. Industrial effluents are contributed from job type J1.
- 4.9 In order to provide a better estimation of pollution loads from industrial processes, the number of

Appendix 5.3

employees in manufacturing sector (J1) was further broken down into 6 sub-categories, namely food, textiles, leather, paper, manufacturing and machinery. Projected employment statistics are not available for these 6 sub-categories. It is noted that the size for each of these 6 sub-categories was estimated under the EPD Update Study. To estimate the size of these 6 sub-categories for this EIA, it is assumed that the share of each sub-category in the manufacturing sector provided in the Update Study would be the same as that for 2011 and 2016.

4.10 Relevant per head flow and load were assigned to residential, transient, commercial and industrial population to obtain the quantity and quality of total untreated wastewater by individual catchment areas. **Table A5-3-8** to **Table A5-3-12** shows the flow and load factors.

- 1. EPD Update Study
- 4.11 Pollution load generation factors for OrthoP and silica are not available. The following assumptions were adopted for calculating OrthoP and silica loading in raw sewage.
 - TP to OrthoP is 1.68 based on the actual measurements of raw sewage at Sha Tin STW and Yuen Long STW.
 - The silica content is approximately 9 mg/l based on the actual measurements of raw sewage at Sha Tin STW.

^{1.} Guidelines for Estimating Sewage Flows for Sewage Infrastructure Planning (Version 1.0), EPD, March 2005

5 CONCURRENT DISCHARGES FROM HATS AND OTHER MAJOR STW

5.1 Effluent discharges from the key STW within the modelling areas were considered separately. These key discharges include the effluent flow from SCISTW, PPSTW, SHWSTW, NWNT outfall, SHTSTW and THEES. The effluent concentrations assumed for these discharges are based on the information from recent EIA studies and actual measurements. The methodology for compiling the flow rates of these key STW is given below.

Flow Estimation for 2011 and 2016

For the purpose of water quality modelling, it was proposed to use the average flow calculated using the unit flow factors from the GESF ¹ and the methodologies discussed in Section 3 and Section 4 for the discharge from SCISTW, PPSTW, SHWSTW, NWNT outfall, SHTSTW and THEES. The average flow used for these STW discharges had also taken into account the catchment inflow factors (P_{CIF}) from the GESF as shown in **Table A5-3-13** below. Flow from relevant landfills and beach facilities as shown in **Table A5-3-4** and **Table A5-3-5** was also included in the flow estimation wherever applicable.

Table A5-3-13 Catchment Inflow Factors from the GESF

Catchment	Catchment Inflow Factor			
Central, North Point, Sandy Bay, Wan Chai, Wah Fu, Central Kowloon, Stanley, Yuen Long, San Wai, North District, Tai Po, North Lantau, Mui Wo	1.00			
Chai Wan, Kwai Chung, Tsing Yi, East Kowloon, Tuen Mun	1.10			
Sha Tin	1.15			
Tseung Kwan O	1.20			
Shau Kei Wan	1.25			
Aberdeen, Ap Lei Chau, Northwest Kowloon, Sai Kung	1.30			
Cheung Chau, Shek O	1.50			

It was assumed that the sewage flow discharged from the catchments of HATS, PPSTW, SHWSTW, NWNT outfall, SHTSTW and THEES was 105% of the total estimated flow that would be generated in the catchment for conservative assessment. For example, as shown in **Table A5-3-1**, 10% of the total sewage flow generated in the Wan Chai catchment would be lost to the storm. For the purpose of modelling, 95% of the total flow generated in the Wan Chai catchment was assumed for discharge to the SCISTW for treatment (i.e. 105% of the total flow was used). For regions outside the catchments of SCISTW, SHWSTW, PPSTW, NWNT outfall, SHTSTW and THEES, it was assumed that the total flow would remain 100%.

Flow Estimation for Ultimate Scenario

- 5.4 It was proposed to use the design plant capacity to calculate the loading discharged from the major STW for 2016 as shown below:
 - PPSTW 558,000 m³/day
 - SHWSTW 168,937 m³/day
 - YLSTW 70,000 m³/day
 - SWSTW 246,000 m³/day
 - THEES 470,000 m³/day
 - SCISTW 2,800,000 m³/day
 - SHTSTW 16,848 m³/day

6 POINT SOURCE POLLUTION LOADS

6.1 The pollution loads from typhoon shelters, marine culture zones adopted in the EEFS are summarized in **Table A5-3-14** and **Table A5-3-15**. These pollution loads were included in the water quality model

Appendix 5.3

Guidelines for Estimating Sewage Flows for Sewage Infrastructure Planning (Version 1.0), EPD, March 2005

under 2011 and 2016 for cumulative assessment. Loading from landfills and beaches that would not be connected to the STW is summarized in **Table A5-3-16** and **Table A5-3-17**.
