

Appendix 2.5

Calculations of Pavement Design for Rock Crusher Use

Typical load from rock crusher = 20 tonnes

Base size of crusher typically 2m x 2m

According to GEO Guide 1 bearing capacity of medium dense soil = 100 kPa

$$\begin{aligned} \text{Imposed pressure from crusher (assuming no spread of load which is conservative)} &= \frac{200 \times 1.6}{2 \times 2} \quad (\text{safety factor of 1.6}) \\ &= 80 \text{ kPa} < 100 \text{ kPa} \quad \text{bearing capacity OK} \end{aligned}$$

$$\begin{aligned} \text{Concrete shear stress capacity} &= 0.8 \times f_{cu} \text{ or } 5 \text{ N/mm}^2 \text{ whichever is lower} \\ &= 5 \text{ N/mm}^2 \end{aligned}$$

$$\begin{aligned} \text{Actual shear stress} &= \frac{200,000}{200 \times 4000} = 0.25 \text{ MPa} < 5 \text{ MPa} \quad \text{Shear strength OK} \\ &\quad (0.2\text{m} \times 4\text{m}) \end{aligned}$$

The bearing capacity and shear for a 200mm thick concrete slab will be sufficient to support the rock crusher use.

INTRODUCTION

Checking for punching stress of potential vehicular load against bearing capacity for the pavement design.

DESIGN ASSUMPTION

According to BD 37/01 Clause 6.2.6

load spread on :

- 1) concrete = 1:1
- 2) subbase = 1:2

According to GEO Guide 1,

Bearing capacity of medium dense soil as revealed through the previous borelogs = **100** kPa

According to Table 2.2.2.5 of TPDM V.2.2,

Weight of axle load of medium and heavy goods vehicles = **10** tonnes
=> Max. wheel load = **50** kN

CALCULATION

Assume contact area of 300 x 300mm for wheel loading which spreads through the concrete pavement and subbase to the existing subgrade underneath with 950mm x 950mm in dimension as calculated.

Therefore,

$$\text{Imposed pressure} = \frac{50 \times 1.6}{0.95 \times 0.95} \quad (\text{Live load safety factor} = 1.6)$$

$$= \underline{\underline{88.64 \text{ kPa}}} < \mathbf{100 \text{ kPa}} \quad \text{bearing capacity OK!}$$

CONCRETE SHEAR

$$\text{Concrete shear stress} = 0.8 \times \sqrt{f_{cu}} \text{ or } 5 \text{ N/mm}^2 \text{ whichever is lower.}$$

$$= 5 \text{ N/mm}^2 = \text{MPa}$$

$$\text{Actual shear stress} = \frac{50 \text{ kN}}{0.2 \times 1} \quad (0.2\text{m} \times 1\text{m})$$

$$= 0.25 \text{ MPa} < \mathbf{5 \text{ MPa}} \quad \text{Shear strength OK!}$$
