GOVERNMENT DEPARTMENT OF

HEALTH

ANNUAL REPORT 1991
CHEST SERVICE
OF THE
DEPARTMENT OF HEALTH

Preface

1991 marked a great and significant change in the organization, administration and operation of the Hong Kong Tuberculosis and Chest Service. Despite the recommendations made by the two overseas consultants, Professor Wallace Fox and Professor Stewart Kilpatrick of the United Kingdom and the working group on their report that it is essential to preserve the continuity of management, both of outpatients and inpatients, and of tuberculosis as well as non-tuberculosis respiratory diseases, and to avoid any division in responsibility between the Hospital Authority and the Department of Health, the Tuberculosis and Chest Service was reorganized in such a way resulting in complete splitting of the hospital chest units from the chest clinics. All the hospital beds were put under the management and administration of the Hospital Authority and all the chest clinics together with their chest x-ray units and the BCG clinic under the Department of Health. 3 consultant chest physicians, 7 senior medical officers and 17 medical officers were absorbed into the hospital staff team of the Hospital Authority and 1 consultant chest physician, 5 senior medical officers and 19 medical officers were kept in the Department of Health with or without their willingness to stay. This caused much unhappiness among the senior staff staying in the clinics. The Hospital Authority officially took over the 38 public hospitals from 1st December 1991. Although patients can still be admitted directly into the hospitals with chest beds, the hospital teams set their own admission criteria and time thus some inconveniences have been caused. The straightforward and uncomplicated cases after discharge are referred back to the chest clinics for follow up but the more interesting or complicated cases are followed up by the hospital teams themselves. The clinic doctors have no access to hospitals for clinical practice or training. There is no continued care of inpatients and outpatients except for those patients being followed up by the hospital teams. The consultant chest physician in charge staying in the Department of Health was given no appointment in the hospital despite the recommendation by the two overseas professors that this person in post should have a dual appointment in both the Hospital Authority and the Department of Health in order to maintain the unity and uniformity of the Chest Service on which the success of the Chest Service was based. Coordination between the hospital chest units and the Chest Service was through individual head of different chest units and the consultant chest physician taking charge of the Chest Service but not in the same way as used to be. Neither the Tuberculosis Co-ordinating Committee to deal with all matters related to tuberculosis, nor the tuberculosis research centre had been formed as recommended by the two overseas professors.

The Tuberculosis and Chest Service, no matter how it had been reorganized, had to survive and continued to play effectively its major role in the prevention and control of tuberculosis through the provision of BCG vaccination, ambulatory antituberculosis treatment, contact examination, health education and to carry out research programme although not in a large scale.

During the year, 86,202 patients attended the government chest service compared with 89,021 in 1990, the total attendance was 718,958 compared with 728,510 in 1990. Of the 86202 patients, 35,855 patients were new attendants of whom 44.5% were found free of any chest disease. The most common respiratory illness diagnosed were respiratory tuberculosis (12.4%), pneumonia (3.9%), bronchiectasis (1.7%), malignant neoplasm of trachea and bronchus (2.7%), bronchitis (4.9%), asthma (0.5%) and emphysema (0.4%). Of the attending patients, 5,056 required hospital admission.

Part I: Tuberculosis

The tuberculosis notifications in 1991 was 6,283 making a notification rate of 109.2 per 100,000 population, the corresponding figures in 1990 were 6,510 and 114.1. The reduction in notification was about 3%.

The tuberculosis deaths increased from 382 in 1990 to 409 in 1991 and the mortality rate therefore from 6.6 to 7.1 per 100,000 population. However the total number was small so the difference may not be significant. Certainly the death rate had to be closely observed.

Tuberculosis was still in the ninth position of the 10 leading causes of death and tuberculosis deaths accounted for 1.4% of the total registered deaths in Hong Kong. There was no infant death in 1991 and the average age of death was 69.

In 1991, 99.3% of the new-borns were BCG vaccinated at birth and 68.2% of the primary school children aged 6-10 were revaccinated after tuberculin testing.

Considerable number of applicants for migration to Australia and Canada attended the clinics for therapeutic or prophylactic treatment.

The important link between HIV infection and tuberculosis was being aware. The special medical consultation service for AIDS had already found tuberculosis in some HIV infected persons and treated them. Unfortunately most of these cases were not notified to the Chest Service for any appropriate action for the sake of keeping confidentiality. Test for HIV infection among tuberculosis patients was only done on voluntary basis with patient's consent.

Part II: Malignant neoplasm of trachea, bronchus and lung

In 1991, the number of inpatients suffering from malignant disease of trachea, bronchus and lung were 11,114 compared with 10,690 in 1990. 2,597 were certified deaths from malignant neoplasm of bronchus and the crude death rate of the disease was 45.1 per 100,000 population. The corresponding figures in 1990 were 2,638 and 45.5. Ca lung remained a serious problem. Intensive anti-smoking campaign and activities need to be maintained.

Part III: Pneumoconiosis

It was questioned that the sufferers of pneumoconiosis were undercompensated. The method of medical assessment and the way of compensation had been under review. Although 171 cases of silicosis were registered in the Chest Service in 1991, only 8 cases including 5 cases of reassessment were assessed by the medical board and compensated. Up to the end of 1991, a total of 3,640 patients were compensated with \$188,848,813.

APPENDIX 35

Scheme for Tuberculin Testing and BCG Administration in Hong Kong, 1991

Population Group	Procedure
New borns and within 6 weeks after birth	Direct BCG - Government inoculators with intradermal method Other inoculators with percutaneous method
Infants (excluding contacts)	negative BCG history and/or negative BCG scar over 6 weeks TT with 1 TU RT 23, negative - ECG positive - observe or no action
	BCG history and BCG scar no action
Primary School Children (aged 6 - 10)	TT with 1 TU RT 23, negative - BCG positive - no action or chest x-ray
Contact	under 5 (Source DS +ve)* X-ray, if normal, in 3 months repeat x-ray and do TT, negative - BCG
	under 5 (Source DS -ve) TT with 1 TU RT 23 negative - BCG positive - x-ray chest
5 years and over	x-ray chest
over 14 years	x-ray chest
Vietnamese Refugees	Direct BCG
14 years and under	Direct BCG

Notes: (1) Tuberculin Test by intradermal method

(2) Reaction to tuberculin

Criterion for + tuberculin reaction : diameter of induration = 10 mm and above
Criterion for - tuberculin reaction : diameter of induration = 9 mm and below

(3) Glaxo freeze dried BCG used

Intradermal strength - viability count of $4 - 13 \times 10^6 / \text{ml}$
Percutaneous strength - viability count of $150 - 750 \times 10^6 / \text{ml}$

(4) Any child with symptoms and BCG complication should be seen by a doctor

* 1 year and under, chest x-ray not necessary except children who are ill or having some clinical abnormality - TT if positive, give Chemoprophylaxis.

TT negative give chemoprophylaxis, repeat TT in 3 months negative BCG stop chemoprophylaxis positive continue chemoprophylaxis.
