ANNUAL REPORT 1993
CHEST SERVICE
OF THE
DEPARTMENT OF HEALTH

Preface

The resurgence of tuberculosis caught worldwide concern in recent few years. In April 1993, the World Health Organization (WHO) has declared global emergency of tuberculosis. It was estimated that tuberculosis will be the leading cause of death for 3 million deaths per year - the biggest number resulting from one single infecting agent.

The devastating link between TB and HIV was causing an explosion of tuberculosis cases in some countries. Other than HIV infected cases, most of the tuberculosis cases were found among the poor, the homeless and the migrants. Furthermore, the problem of drug resistance is very alarming. In the face of this health threat, WHO has called for strengthening preventive and control measures on tuberculosis in all countries so as to achieving its global target of TB control by the year 2000 as below :-

- (a) treat 85% of detected smear positive cases successfully.
- (b) detect 70% of smear positive cases.

In 1993, the Tuberculosis and Chest Service continued to maintain its effective control on tuberculosis in Hong Kong. Standardized 6-month short-course chemotherapy was given under full supervision to the patients. For the purpose of monitoring, evaluation of treatment results using quarterly and annual cohort analysis were carried out.

Close collaboration and co-operation with hospital chest units in fighting tuberculosis was very important. Through the meetings of Tuberculosis and Chest Sub-committee, established by the Hospital Authority co-ordination between government chest service and individual hospital chest units particularly in aspects of patient referrals, hospital admission/discharge, and follow-up management has slightly improved. To further enhance mutual effectiveness on both policy and operational levels, a committee comprised also with officers from high administrative rank had to be formed in near future.

The shortage of senior medical staff remained a serious problem in the service. Out of seven SMO posts, only three were filled by substantive SMO with higher medical qualification and adequate medical experience. Inadequate senior medical staff created difficulties on staff management, supervision and training of junior doctors.

After the split of hospital-based and out-patient chest service, clinic doctors were not allowed to have access to hospitals. The lack of hospital training not only weakened the incentive and interest of doctors in the Service, but also failed to provide for them the necessary requirement of 3-year basic training in general medicine in acute hospital for MRCP qualification and the 3 years subspecialty training in

respiratory medicine for subspecialty accreditation by the Hong Kong Academy of Medicine. The Service was thus encountering problems in retaining and attracting capable and competent doctors.

Despite of various problems, the Service has maintained an effective delivery of service to the public. Quality curative medical care were also provided to patients with different kinds of chest diseases besides tuberculosis.

BCG vaccination, surveillance, contact tracing, supervised chemotherapy, research, and health education remained as the major components of our effective tuberculosis control programme. The notification of tuberculosis increased by 3 cases in 1993, but the rate has not increased because of the growth of the population.

During the year, 84,540 patients attended the government chest service compared with 92,574 in 1992, the total attendance was 730,563 compared with 727,081 in 1992. Of the 84,540 patients, 37,366 patients were new attendants of whom 39.3% were found free of any chest disease. The most common respiratory illness diagnosed were respiratory tuberculosis (12.0%), pneumonia (3.6%), bronchiectasis (1.8%), malignant neoplasm of trachea and bronchus (2.7%), bronchitis (6.9%), asthma (0.7%) and emphysema (0.4%). Of the attending patients, 5,159 required hospital admission.

Part I : Tuberculosis

The tuberculosis notifications in 1993 was 6,537 making a notification rate of 110.4 per 100,000 population, the corresponding figures in 1992 were 6,534 and 112.4.

The tuberculosis deaths decreased from 410 in 1992 to 396 in 1993 and the mortality rate was changed from 7.1 to 6.7 per 100,000 population from 1992 to 1993.

Tuberculosis was still in the eleventh position of the leading cause of death and tuberculosis deaths accounted for 1.3% of the total registered deaths in Hong Kong. There was one infant death from miliary tuberculosis in 1993. The average age of death was 69.

In 1993, 99.6% of the new-borns were BCG vaccinated at birth and 70.6% of the primary school children aged 6-10 were revaccinated after tuberculin testing.

Considerable number of applicants for migration to Australia and Canada attended the clinics for therapeutic or prophylactic treatment.

The important link between HIV infection and tuberculosis was established. Unfortunately, the special medical

consultation service for AIDS and the chest service is working independently without any collaboration. Most of the tuberculosis cases discovered by the special medical service group were not notified to the chest service for any appropriate action for the sake of keeping confidentiality. Test for HIV infection among tuberculosis patients in the chest service was only done on voluntary basis with patient's consent, yet the positive rate was very low.

Part II : Malignant neoplasm of trachea, bronchus and lung

In 1993, the number of inpatients suffering from malignant disease of trachea, bronchus and lung were 12,371 compared with 11,670 in 1992. 2,834 were certified deaths from malignant neoplasm of bronchus and the crude death rate of the disease was 47.9 per 100,000 population. The corresponding figures in 1992 were 2,761 and 47.5. Ca lung was still a serious problem. Anti-smoking campaign and activities should be stepped up.

Part III : Pneumoconiosis

In July 1993, the new Pneumoconiosis Compensation Amendment Bill was enacted to provide more comprehensive and continued compensation to the patients for incapacity resulting

from pneumoconiosis. The scheme adopts a new assessment system, replaces the one-off payment method by a monthly payment of compensation and introduces a two-year re-examination system for all pneumoconiosis. 249 cases of silicosis were registered in the chest service in 1993, and 229 cases including 4 cases of asbestosis were assessed by the medical board and 154 cases compensated. Up to the end of 1993, a total of 3,984 patients had been compensated \$233,435,416.

APPENDIX 35

Scheme for Tuberculin Testing and BCG Administration in Hong Kong, 1993

Population Group		Procedure
New borns and within 6 weeks after birth		Direct BCG – Government inoculators with intradermal method Other inoculators with percutaneous method
Infants (excluding contacts)	negative BCG history and/or negative BCG scar	over 6 weeks TT with 1 TU RT 23, negative – BCG positive – observe or no action
Primary School Children (aged 6 – 10)	BCG history and BCG scar	no action
Contact	under 5 (Source DS +ve) *	TT with 1 TU RT 23, negative – BCG positive – no action or chest x-ray
	under 5 (Source DS -ve)	X-ray, if normal, in 3 months repeat x-ray and do TT, negative – BCG
Vietnamese Refugees	5 years and over	TT with 1 TU RT 23, negative – BCG positive – x-ray chest
	over 14 years	x-ray chest
	14 years and under	Direct BCG

Notes : (1) Tuberculin Test by intradermal method

(2) Reaction to tuberculin

Criterion for + tuberculin reaction : diameter of induration = 10 mm and above
Criterion for – tuberculin reaction : diameter of induration = 9 mm and below

(3) Glaxo freeze dried BCG used

Intradermal strength – viability count of $4 - 13 \times 10^6 / \text{ml}$

Percutaneous strength – viability count of $150 - 750 \times 10^6 / \text{ml}$

(4) Any child with symptoms and BCG complication should be seen by a doctor

* 1 year and under, chest x-ray not necessary except children who are ill or having some clinical abnormality.
Do TT, if positive, give Chemoprophylaxis. If TT negative give Chemoprophylaxis, repeat TT in 3 months.
If negative, give BCG, stop Chemoprophylaxis; if positive, continue Chemoprophylaxis.

- Note : (a) By "number eligible" is meant the total population in the specified age group which it was intended to test and or vaccinate, i.e. the number of persons in each area who could have been tested and/or vaccinated during the period of reporting according to the prevailing policy, by the staff assigned to that area (this follows W.H.O. practice).
- (b) Percentage refusals refer to those refusing to be tuberculin tested.
- (c) Direct BCG was introduced in remote areas w.e.f. 27.10.1975 and number of BCG given includes direct BCG without TT.
- (d) No direct BCG was given in 1992 and number of direct BCG given in previous years were not recorded separately.

Note: (a) The Pneumoconiosis Compensation Scheme was initiated in 1980, before that notifications were voluntary.

(b) The figures in this column denote the patient of asbestos.

(c) Up to the moment that this report is being compiled, only 229 of the 249 cases notified in 1993 had been assessed and confirmed Pneumoconiosis by the Pneumoconiosis Medical Board. And the following tables (Appendix 2 to Appendix 8) are compiled based on the data of these 229 cases.

(d) Under Revised Ordinance 1993: 522 out of 1,492 pneumoconiotics receive each monthly ex-gratia payment of \$3,000.
